

Building Arrays

Materials: dice, counters

1. Roll the die twice. The first number you roll tells how many rows to make in your array. The second number you roll tells how many counters to put in each row of your array.

Example: If you roll a 2 first and then a 5, you might make this:

2. Draw each array you make.
3. Record how many rows, how many counters in each row, and how many counters in all for each array you make.
